FluoroFlow High Performance PTFE Bellows

www.crp.co.uk
www.ptfebellows.com

Corrosion Resistant Products

CRP has been designing, processing and manufacturing top quality paste extruded PTFE and PFA lined products for more than 35 years. All of our products originate from our manufacturing site near Manchester, UK. Using qualified materials, robust and repeatable manufacturing process technologies and a depth of experience CRP are able to deliver product for the most exacting applications.

Introduction

The FluoroFlow Bellows (FFB) range has been engineered over 40 years to compensate for thermal expansion in pipelines; for the protection of fragile process equipment such as graphite, plastic or glass and the isolation of vibration hazards. PTFE bellows come into their own for corrosive, high purity or hot applications.

CRP has some unique manufacturing processes based upon the use of paste extruded PTFE, and a proprietary convolution process. These have been independently tested by the internationally recognised safety and quality group TÜV, undertaking innovative long term pressure increase testing.

The Product Family

The bellows product range covers 22 sizes from DN25 / 1"NB to DN1050 / 42"NB. They are manufactured in two materials—virgin PTFE and static dissipating PTFE. FluoroFlow Bellows in sizes DN25 / 1" to DN250 / 10" are available in extra heavy duty only. For larger diameters there is a choice of two wall thicknesses—a heavy duty (HD) and extra heavy duty (XHD). The bellows can be manufactured with 2 to 10 convolutions. However, this is just the standard product. The flexibility of the manufacturing method is such that many special configurations can be produced to meet specific customer requirements.

For products requiring a higher pressure rating than is possible with PTFE alone, we have our range of armoured bellows (FFAB) where the PTFE is surrounded by a high pressure stainless steel shell.

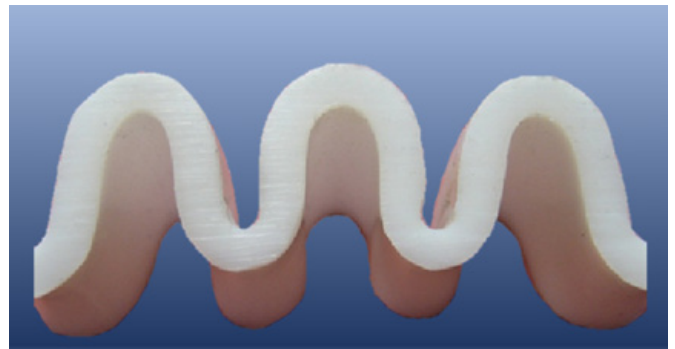

HiPerFlon®

HiPerFlon® is a second generation paste extruded High Performance PTFE. HiPerFlon® has the

greatest mechanical properties and lowest permeation rates of PTFE materials and as such provides high pressure ratings, long lifetime, low maintenance costs and consequently the lowest cost of ownership.

The Manufacturing Process

CRP uses virgin paste extruded or virgin multi-ply PTFE tubes of their own manufacture to guarantee the highest quality from the beginning of the production process. A unique convolution process undertaken at very high temperatures, combined with additional material to compensate for the extra length from straight to convoluted, provides a uniform PTFE wall thickness and a stress-free material in a thermally locked bellows shape. This process has a significant influence on product lifetime performance.

Bellows Design and Type Testing

A key consideration in bellows performance is the temperature and pressure that the bellows will withstand for extended periods of time. There are no ASME, DIN or other global standards for bellows design. Most of CRP's competitors just use a simple burst pressure test at ambient temperature to create the comprehensive pressure / temperature curves in their catalogues, sometimes with a safety factor of less than 3.

A safety factor is defined as the ratio of burst pressure to allowable operating pressure. Bursting pressure tests, although a key indicator, cannot fully define a bellows performance as a burst pressure test has a duration of 10 to 20 seconds and is unable to replicate the effect of deformation of the bellows through creep.

Therefore CRP has developed a much more comprehensive approach to testing as follows:

Bursting Pressure Test

Bursting pressure tests are used only for the determination of pressure rating at ambient (20°C) temperature. At this temperature CRP has adopted a safety factor of 6 for bellows up to DN200 and a safety factor of 4 for the larger diameters.

Pressure Increase Test

In addition to the bursting pressure tests, innovative pressure increase tests have been undertaken successfully at 100°C, 150°C and 200°C by TÜV. These unforgiving tests slowly increase the delivered pressure to the bellows at high temperatures, encouraging the PTFE material to flow and creep as in service. The pressure increase test results confirm the outstanding creep resistance of the FluoroFlow Bellows provided by the unique convolution process.

Internal Pressure Long Term Creep Test

FluoroFlow Bellows have passed successfully an Internal Pressure Creep Test (similar to EN ISO 9080) by TÜV at 150°C. 14 Bellows have been tested in total and two bellows remained under pressure at 150°C in the oven for one year. This confirms the long term creep resistance even at high temperatures and pressures.

Lifetime Assurance

Based on the pressure / temperature limits from these tests, CRP has determined the pressure / temperature curves for the FluoroFlow Bellows to have a residual safety factor of 2 after more than 10 years in operation.

International Standards

All bellows, comply with the Pressure Equipment Directive 2014/68/EU (PED) and the Pressure Equipment (Safety) regulations 2016 (PE(S)R), they are CE / UKCA marked where appropriate, and are provided with CE / UKCA Declaration of conformity. PTFE armoured bellows for high pressure performance are designed according to the Expansion Joint Manufacturers Association (EJMA) international standard. The business is third party accredited to ISO9001:2015.

Product Testing

Bellows materials are fully traceable. Bellows tubes undergo mechanical and dimensional tests following manufacture. PTFE sintering and convoluting are undertaken using calibrated ovens with precise temperature control. Independent process checks are undertaken using infra-red thermometry. In-process visual inspection of the PTFE tubes is undertaken and this combined with a hydrostatic test and further visual inspection of the finished product completes the product verification. Certification is available if required to reassure the customer on materials of construction, process control and product testing.

Operating Temperatures

The standard operating envelope for the product is 0°C to 200°C, but with selection of different flange materials the bellows can be supplied for temperatures outside this envelope.

Special Bellows

Many customized bellows are available, including bellows with extended flares, reducing bellows (different flange sizes), different flange types, hinged bellows, lateral bellows, dual containment bellows, bellows with special neutral lengths and bellows with special PTFE wall thicknesses.

Internal vacuum support rings can be provided in exotic metals or PTFE lined and the bellows flanges can be manufactured in other metals. Bellows with electrically isolating tie rods are also available.

PTFE Bellows with stainless steel flanges

Safety Shields

Following guidance from the European Pressure Equipment Directive 2014/68/EU and international insurers, we strongly recommend the use of Safety Shields around each bellows.

Because of its nature, the bellows is the weakest part of a piping system and safety shields can assist in mitigating risk to operators and the environment.

Glassfibre Coated PTFE shield with FEP Window

Smoothbore Sleeves

If handling media at high velocities or with entrained solids we suggest you consider using smoothbore sleeves. These are manufactured from PTFE and provide additional protection to the bellows for abrasive duties as well as minimising the potential build up of solids in the convolutions. As standard these are supplied as a loose fit to avoid the sleeve constraining the bellows movement. However a tight fit is also available. As standard the sleeve is sized to protrude just beyond the end of the bellows when it is at maximum axial length, but this can be specified at the time of order. Anti-static smooth bore sleeves are also available.

Design and Piping Layout

Prior to specifying the bellows it is necessary to produce a piping layout with correct pipe supports and an exact specification of the expected movements, irrespective of whether they are to be used for thermal compensation or the protection of fragile equipment made of glass or graphite. Bellows cannot support forces either from the weight of the piping components or from the liquid inside the pipes.

Effective Area and Spring Rates

The effective area and the spring rates have a significant influence upon the stress calculations for the piping system. Please find the relevant data on the following pages for each bellows size. For the influence of temperature upon spring rates please use the conversion table on the next page.

Temperature Correction Factors (TCF)		
°C	°F	TCF
20°	68°	1.00
80°	176°	0.65
120°	248°	0.50
150°	302°	0.40
200°	404°	0.30

For example: To calculate the spring rate @ 120°C take the spring rate @20° and multiply by 0.5.

Operating and Installation Instructions

A comprehensive user manual is packed with the bellows shipment. These instructions can also be downloaded from our website (www.crp.co.uk) or can be sent out by email (enquiry@crp.co.uk). It is critical that these are referred to for the correct installation of bellows.

Key Product Features

Flanges

Bellows flanges are available to all of the international flange standards including ASME Class

150 and 300 and DIN PN 10 and 16. As standard the flange bolt holes are drilled and tapped either UNC for ASME or Metric Series for DIN. Flanges are painted in an ultra high temperature paint in a silver finish. It is worth noting the internal flange profiling that assists the first convolution in minimising any stress generated by the flange.

PTFE Convolutions

The number of convolutions is key to the range of movement provided by the bellows — the more convolutions the greater the range of movement. However the compromise is that both pressure and vacuum performance are reduced as the number of convolutions increases.

In sizes above DN250 / 10"NB there is the option of Heavy Duty (HD) or Extra Heavy Duty (XHD) Bellows. The additional wall thickness of the XHD product provides an improved temperature and pressure range. Up to DN250 / 10"NB XHD is the standard liner we produce bellows from.

The number of convolutions is key to the range of movement provided by the bellows—the more convolutions the greater the range of movement. However the compromise is that both pressure and vacuum performance are reduced as the number of convolutions.

Root Rings

Root rings serve to provide support for the PTFE which is a mechanically weak material especially when hot. These sit at the base of each convolution.

These are supplied in stainless steel as standard, but can be manufactured in exotic metals where required—for example to avoid the potential for stress corrosion cracking in hydrochloric acid service.

Tie Rods

These prevent the bellows from exceeding their maximum allowed movements. They arrive factory set at the maximum allowable extension as detailed on the data label. The tie rods have been sized to cope with the maximum pressure thrust that can result from internal pressure in the bellows, both in operation and during test. However, tie rods are not designed to cope with external loads applied to the bellows by the adjacent pipe work due to circumstances such as pipework misalignment, failure of anchors etc.

Limit Sleeves

These prevent damage to the convolutions by preventing the bellows from being compressed below the minimum allowable axial length.

Anti-Snake Rings

When the number of convolutions exceeds five we would recommend one or more Anti-snake rings. These are mounted on the outside of the bellows, replacing and serving the role of the root ring, but also tying into the tie rod to prevent the bellows squirming under high temperatures and pressures.

Vacuum Support Rings

Internal vacuum support rings are available for larger bellows where they have a low or no vacuum performance. They will enable the bellows to perform under full vacuum. These rings fit inside the bellows convolutions, so are exposed to the process. They are available either PTFE encapsulated on the outside, or in various exotic metals. They may reduce bellows movements, so please consult with us.

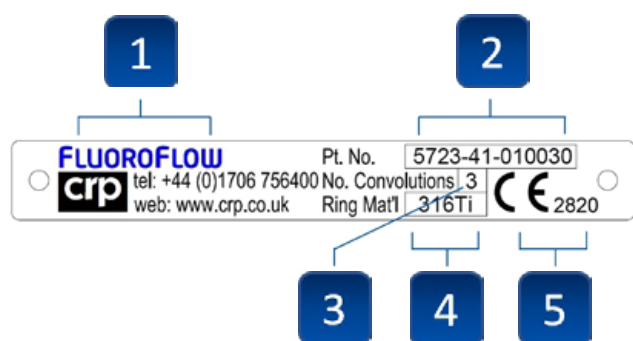

Data Labels

There are three or four data labels riveted to the bellows flanges to carry as much information about the bellows as practical.

However, more information is available in this catalogue, or by reference to CRP, quoting the part number and serial number references.

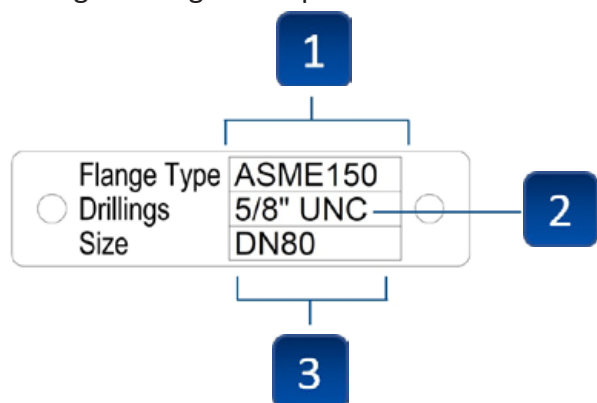

Identification Nameplate

1. The product family is referred to as FluoroFlow Bellows or “FFB”.
2. The CRP part number.
3. The number of convolutions.
4. The material used for the root rings.
5. Our CE mark and notified body number for compliance with the PED (Pressure Equipment Directive).

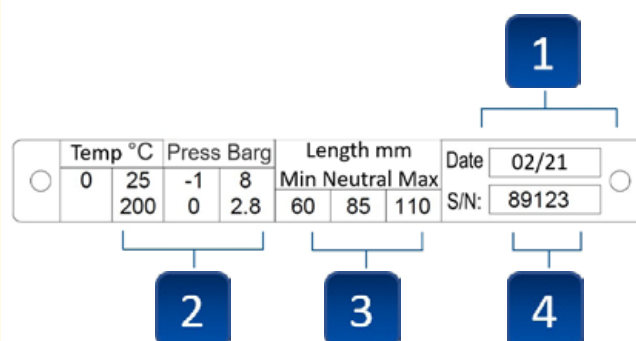

Flange Drillings Nameplate

If the flanges are identical there will be one of these labels. However should the flanges be dissimilar, there will be a label on each flange.

1. The flange type.
2. The size and thread type for the drillings.
3. The bellows nominal size or in the case of reducing bellows, the flange size at each end.

Operating Parameters Nameplate

1. The month and year of manufacture.
2. Two rows of temperature and pressure information. In this example showing the performance at 0°C to 25°C (-1 up to 8 Barg) and 200°C (0 up to 2.8 Barg). There is not always enough room to show the maximum temperature which can cope with full vacuum, nor provide intermediate data. Reference to the data sheets in this catalogue can provide more information.
3. The minimum, neutral and maximum lengths for axial travel.
4. A unique serial number for the item.

Explanation of Movements

A key attribute of bellows is their ability to move in response to stresses placed upon them by the equipment to which they are mounted, whether such stresses are generated by expansion and contraction or plant vibration.

There are three directions of movement for which a bellows is designed; axial, lateral and angular. Please note that bellows are not designed for rotational movement around the principal axis.

The allowable movements are dependent upon nominal bore and number of convolutions and are provided on the following individual product nominal bore pages. It is important to understand that these movements are not independent.

Combined Movements

When calculating maximum combined movements consider the total allowable in all three directions as comprising 100%. This 100% can be apportioned across the three movement

types. For instance if a bellows were installed at an axial length utilising 50% of the allowable axial movement of the bellows and there were no angular movement, only 50% of the published lateral movement would be remaining within the safe movement limits with these concurrent movements. If 25% of the maximum allowable angular movement was utilised concurrently with 50% of the axial movement then only 25% of the lateral movement would be remaining.

Axial

This is the most frequently required type of movement and is specified in terms of the bellows minimum and maximum extension and its neutral length. The neutral length is the mid-range position of the bellows. Bellows can be installed at lengths between the minimum and maximum length, but this of course will restrict the amount of allowable movement. CRP Bellows do not require restraining to hold their neutral length and are delivered with the flanges sitting at their neutral length with the tie rods set to their maximum extension.

Axial Only Bellows

Lateral

Lateral movement is movement at right angles to the principal axis.

Angular

Angular movement is the movement of the flanges out of parallel.

Modified Movement Bellows

The mechanical design of the flanges, tie rods and limit sleeves are to restrict bellows movement within their safe range. However, it may be necessary to change movement still further, such as preventing movement in one or more planes, focus all movement in one plane or create additional movement. Special bellows are available for these purposes.

Axial Only Bellows [Axial Bellows]

By providing an external frame with guide rods, the bellows can be restricted to axial movement only.

Movement	Possible
Axial	✓
Lateral	no
Angular	no

Lateral Only Bellows [Lateral Bellows]

Tie rods with special spherical washers capturing the flange face allow movement in any lateral plane.

Movement	Possible
Axial	no
Lateral (any plane)	✓
Angular	no

One Plane Angular Bellows [Hinged Bellows]

Hinged bellows allow angular movement only in one plane, thereby maximising the angular range.

Movement	Possible
Axial	no
Lateral	no
Angular (one plane)	✓

All Planes Angular Bellows [Gimballed Bellows]

As with the hinged bellows they allow only angular movements, but with the addition of gimbals enables angular movement in any plane.

Movement	Possible
Axial	no
Lateral	no
Angular (any plane)	✓

Large Movement Lateral Bellows [Universal Bellows]

An arrangement of two bellows incorporating a short PTFE lined pipe spool provides a large amount of lateral movement by effectively converting each bellows into an angular bellows.

Movement	Possible
Axial	✓
Large Lateral	✓
Angular	✓

FluoroFlow FFB PTFE Bellows are manufactured from virgin or static dissipating paste extruded HiPerFlon® PTFE. They are manufactured using a unique process which ensures a uniform PTFE wall thickness and eliminates stress in the PTFE from the convolution process. These bellows have an Extra Heavy Duty "XHD" liner.

Images are illustrative only, actual bellows may differ.

Dimensions and Movements ¹						Weight

FFB 5 XHD	-1.0	-1.0	-1.0	-1.0

- Notes:
1. Larger movements are available with more convolutions. These are not combined movements, please refer to page 7 for info.
 2. Please refer to page 3 for temperature correction factors for spring rate.
 3. As standard flange holes are threaded. Clearance holes are possible for certain sizes please contact us.
 4. The maximum number of convolutions for this size is 10, please consult us for further information on these.
 5. For operating temperature and pressure for more than 5 convolutions please contact us.

FluoroFlow FFB PTFE Bellows are manufactured from virgin or static dissipating paste extruded HiPerFlon® PTFE. They are manufactured using a unique process which ensures a uniform PTFE wall thickness and eliminates stress in the PTFE from the convolution process. These bellows have an Extra Heavy Duty "XHD" liner.

Vacuum Performance

Whilst the standard bellows are not suitable for use under vacuum, they can be supplied with internal vacuum support rings to provide full vacuum performance. Vacuum support rings can be manufactured from Hastelloy, Titanium, Tantalum or PTFE encapsulated etc.

- Notes:

Bellows	Multi-ply Virgin PTFE to ASTM D4894 Type IV
Flanges	Carbon Steel to BS1501-161-430A / P265GH Typical
Paint	Ultra-High Temperature in Silver
Root Rings	Stainless Steel to 320S31 (316Ti)
Tie Rods & Nuts	Carbon Steel Grade 8.8 Zinc Plated
Limit Sleeves	Stainless Steel to ASTM A312 Gr. 304/304L

Flanges			
	ASME Class 150	DIN PN10	DIN PN16
Raised Face Ø	470mm	482mm	490mm
Bolt Circle Ø	540mm	515mm	525mm
Flange Ø max	700mm		
Bolt Holes ³ [No x Thread]	16 x 1"UNC	16 x M24	16 x M27
Thickness	20mm		
Effective Area	141,100mm ²		

Options	
Component	Options
Bellows	Multi-ply Static-Dissipating ASTM D4894 Type IV
Flanges	Stainless Steel, Hastelloy, Low Temperature Steels etc.
Root Rings	Hastelloy, Monel etc.
Tie Rods & Nuts	Stainless steel, Hastelloy, Monel etc.
Anti-Snake Rings	Stainless Steel

Vacuum Performance

Whilst the standard bellows are not suitable for use under vacuum, they can be supplied with internal vacuum support rings to provide full vacuum performance. Vacuum support rings can be manufactured from Hastelloy, Titanium, Tantalum or PTFE encapsulated etc.

Notes:

1. Larger movements are available with more convolutions. These are not combined movements, please refer to page 7 for info.
2. Please refer to page 5 for temperature correction factors for spring rate.
3. As standard flange holes are threaded. Clearance holes are possible for certain sizes please contact us.
4. The maximum number of convolutions for this size is 10, please consult us for further information on these.
5. For operating temperature and pressure for more than 5 convolutions please contact us.

FluoroFlow FFB PTFE Bellows are manufactured from virgin or static dissipating multi-ply HiPerFlon® PTFE. They are manufactured using a unique process which ensures a uniform PTFE wall thickness and eliminates stress in the PTFE from the convolution process. These bellows are available with Heavy Duty "HD" or Extra Heavy Duty "XHD" liners.

Armoured FluoroFlow FFAB PTFE PN16 Bellows are available in 2 lengths for most sizes as standard and manufactured from virgin HiPerFlon® PTFE combined with a multi-layered austenitic stainless steel shell to provide high pressure performance outside the range of conventional PTFE bellows. This range is designed to the EJMA international standard.

Materials	
Component	Materials
Bellows Liner	Paste Extruded Virgin PTFE to ASTM D4895
Bellows Shell	Stainless Steel to 321S31 /321 /1.4541
Flanges	Carbon Steel to S235JRG2 / RSt 37.2
Paint on CS flanges	Zinc Epoxy Primer, Colour Grey

Options	
Bellows Liner	Paste Extruded Static-Dissipating PTFE to ASTM D4895
Bellows Shell	Hastelloy & other Exotic Materials
Flanges	Stainless Steel, Exotics etc.
Bolt Holes	Threaded Holes UNC or Metric
Tie Rods	Available as an option

Notes:

1. Spring rates are for both axial extension and compression.
2. Tie rods are not supplied as standard but are available, including with spherical washers as required.
3. For vacuum performance information please refer to page 33.

FluoroFlow FFAB Armoured PTFE Bellows DN40 / 1.1/2"NB - DN400 / 16"NB 16BARg Long Series

Armoured FluoroFlow FFAB PTFE PN16 Bellows are available in 2 lengths for most sizes as standard and manufactured from virgin HiPerFlon® PTFE combined with a multi-layered austenitic stainless steel shell to provide high pressure performance outside the range of conventional PTFE bellows. This range is designed to the EJMA international standard.

Notes:

1. Spring rates are for both axial extension and compression.
2. Tie rods are not supplied as standard but are available, including with spherical washers as required.

Armoured FluoroFlow FFAB PTFE PN25 Bellows are manufactured from virgin HiPerFlon® PTFE combined with a multi-layered austenitic stainless steel shell to provide high pressure performance outside the range of conventional PTFE bellows. This range is designed to the EJMA international standard.

Materials	
Component	Materials
Bellows Liner	Paste Extruded Virgin PTFE to ASTM D4895
Bellows Shell	Stainless Steel to 321S31 /321 /1.4541
Flanges	Carbon Steel to S235JRG2 / RSt 37.2
Paint on CS flanges	Zinc Epoxy Primer, Colour Grey

Options	
Bellows Liner	Paste Extruded Static-Dissipating PTFE to ASTM D4895
Bellows Shell	Hastelloy & other Exotic Materials
Flanges	Stainless Steel, Exotics etc.
Bolt Holes	Threaded Holes UNC or Metric
Tie Rods	Available as an option

Notes:

1. Spring rates are for both axial extension and compression.
2. Tie rods are not supplied as standard but are available, including with spherical washers as required.
3. For vacuum performance please refer to page 33.

Bellows Specifier Cut Sheet

PTFE Bellows need to be specified accurately to perform safely and have a long life. Beyond the basics of nominal bore size, media, temperature and pressure, the movements required from the bellows are critical. The individual data sheets for each bellows size provide the data for our standard products. If this does not suit your application then please contact us with the information below and allow us to help.

Customer Name Media

Operational Information

Minimum Operating Temperature °C Maximum Operating Temperature °C
